LETTER OF TRANSMITTAL

PENNSYLVANIA DEPARTMENT OF AGRICULTURE
BUREAU OF FOODS AND CHEMISTRY

Harrisburg, April 25, 1929.

Hon. C. G. Jordan,
Secretary of Agriculture,
Harrisburg, Pa.

Dear Sir:

I have the honor to transmit herewith for your approval a report showing the tabulated results of chemical analyses made by this Bureau, in accordance with the requirements of the Fertilizer Law, of the official samples of Commercial Fertilizers obtained by the Special Agents during the Spring and Fall shipping seasons of 1928.

It is recommended that this report be published in bulletin form for distribution.

Very respectfully,
JAMES W. KELLOGG,
Director—Chief Chemist.

FERTILIZER REPORT

1928

Introduction

The Fertilizer Law, Act of May 1st, 1909, as amended, defines Commercial Fertilizers as including any and every substance sold for fertilizing or manuring purposes except marl, lime, wood ashes and the dung of domestic animals; fixes a standard of not less than fourteen units or 14 per cent. of total plant food, nitrogen equivalent to ammonia, available phosphoric acid and potash, for mixed Fertilizers; provides that all brands be registered for each calendar year and before being offered for sale and requires all sacks or attached cards to be printed with net weights, brand or trade names, names of Manufacturers or Importers and guarantees for the minimum percentages of nitrogen, ammonia, total and available phosphoric acid and water soluble potash which they contain. All Fertilizers containing less than 1 per cent. of ammonia, available phosphoric acid or water soluble potash and mixtures having the word "tobacco" as a part of the brand name and which contain chloride of potash, are prohibited. A license fee of from \$15 to \$50 is required to be paid for every brand or kind of Fertilizer registered, the rates being \$15 for new brands and in the case of brands sold during any preceding year and re-registered the fees are based on the tonnage amount sold as follows: Sales up to 150 tons, \$15; 150 to 250 tons, \$20; 250 to 400 tons, \$30; 400 to 500 tons, \$40, and over 500 tons, \$50.

The number of tons of Fertilizer sold during the preceding year is required to be reported and included with applications for registrations on forms which are supplied regardless of whether any brands sold during a preceding year may be re-registered or discontinued in order that the amount of fees may be estimated for those to be registered and the amount of tonnage sales in all cases properly recorded.

Enforcement of the law is provided for by authorizing the collection and analyses of official samples for the purpose of establishing the correctness of guarantees and method of branding and for the publication of the results obtained for the information of the public. Accordingly during the Spring and Fall shipping seasons Special Agents of the Bureau collected 2562 official samples from selling agencies throughout the Commonwealth and submitted them for examination, together with reports covering each lot or shipment sampled showing the information printed upon sacks or attached cards and sales conditions. Of this number, 2,291, representing brands registered for 1928, were accordingly

analyzed for the amounts and forms of plant food which they were guaranteed to contain, namely, nitrogen, total, available and insoluble phosphoric acid and water soluble potash. There were 688 different brands registered by 78 Manufacturing and Importing firms, which, together with the number of brands and samples in each, were as follows:—

	<i>Brands</i>	<i>Samples</i>
Complete Fertilizers	452	1,562
Ground Bone Fertilizers	26	60
Superphosphate Fertilizers	70	326
Lime Phosphate Fertilizers	13	34
Rock and Potash Fertilizers	57	174
Miscellaneous Fertilizers	70	135
Totals	688	2,291

Registrations were received from 138 Manufacturing and Importing firms for 1928 and 263 licenses were issued, authorizing the sale of 1232 different brands and kinds of Fertilizers of which 842 represented mixed Fertilizers containing 14 per cent. or more total units of plant food and 390 base materials. The amount of Fertilizers sold during the preceding year, 1927, reported with applications for 1928 registration, totalled 326,514 tons, which amount is 2390 tons less than reported as being sold for 1926. Of this amount 211,692 tons were Complete Fertilizers, 67 tons Nitrogen and Phosphoric Acid Fertilizers, 19,211 Phosphoric Acid and Potash Fertilizers, 81,704 tons Superphosphate Fertilizers, 3,606 tons Ground Bone Fertilizers, 2,457 tons Tankage, 3,407 tons Nitrate of Soda, 2,361 tons Potash Fertilizers, 1,363 tons Sulphate of Ammonia, 15 tons Dried Blood and 631 tons of Miscellaneous Fertilizers. The amount of plant food supplied by the total tonnage reported as being disposed of during 1927 and as estimated from the guarantees included in registration was approximately 5,875 tons of ammonia, 52,149 tons of available and total phosphoric acid and 22,777 tons of water soluble potash, making a total of 80,801 tons of plant food.

CONCLUSIONS

The results of the 1928 inspection compared with that of the preceding year shows considerable improvement in guarantees for the plant food supplied. The average composition of each class was slightly higher than the averages estimated for 1927, showing a tendency to increase the plant food units and to sell higher grade materials. It may be fairly stated, therefore, that while the proportion of variations from guarantees is low, making continued improvement desirable, the general situation with respect to the sale of Fertilizers is such as to afford to consumers ample protection against the sale of misbranded materials.

The results of analyses of the 2,291 official samples showed that 264, or 11.5 per cent., were deficient in one or more forms of plant food guaranteed. Samples were classified as deficient which failed to meet guarantees to the extent of .20 per cent. or more and in

the case of guarantees of .50 per cent. or less where deficiencies amounted to .1 per cent. or more. This proportion of deficiencies was considerably less than that of 18.9 per cent. estimated for the 1927 inspection as well as approximately the same proportion lower than for the 1924, 1925 and 1926 seasons' inspection work, and shows a considerable improvement in the method of guaranteeing for the Fertilizers offered for sale during 1928, based on the samples examined. The proportion of deficiencies in the separate classes of Fertilizers were as follows: Completes 14.1 per cent., Ground Bones 13.3 per cent., Superphosphates 1.2 per cent., Lime Phosphates 8.8 per cent., Rock and Potash 10.9 per cent. and Miscellaneous Fertilizers 7.4 per cent. The estimated deficiencies for each form of plant food taken separately shows that 55, or 3.2 per cent., of those guaranteed for nitrogen were deficient, 8, or 10.8 per cent., were deficient in total phosphoric acid, 79, or 3.8 per cent., in available phosphoric acid and 143, or 8.0 per cent., in water soluble potash. A comparison of the deficiencies for each form of plant food estimated for the 1927 inspection shows corresponding decreases as in the case of the total deficiencies except in the case of total phosphoric acid, which was about 1 per cent. higher than for 1927.

The 1,232 brands of Fertilizers registered for 1928 sales were slightly lower than the 1,272 registered for the preceding year. There was also a corresponding decrease in the tonnage sales of 326,514 reported for 1927 activities compared with 328,904 tons disposed of during 1926. On the other hand the total of 80,801 tons of plant food supplied by the Fertilizers reported as sold during 1927 was in excess of the 55,402 tons estimated as being supplied by the brands reported as sold during 1927, which figures were arrived at from the guarantees accompanying each class and brand included. This increase in total plant food tonnage may be largely attributed to an increase in the proportion of total plant food supplied by the Fertilizers disposed of and as a result of the requirements in the law, which prohibits the sale of mixtures containing less than 14 total units of plant food. Microscopical examinations of the samples did not reveal the presence of prohibited materials. There were, however, a number of non-registered brands found being offered for sale, making it necessary to hold the Selling Agents responsible for these failures to meet the requirements.

The average retail selling values per ton for the several classes of Fertilizers were estimated as follows: Complete Fertilizers, \$34.08; Ground Bone Fertilizers, \$55.49; Superphosphate Fertilizers, \$21.51; Lime Phosphate Fertilizers, \$21.88; Rock and Potash Fertilizers, \$26.46 a ton. These average values were all in excess of those estimated for the same classes reported for the 1927 inspection, as will be noted in Table II. On the basis of these retail values approximate average unit values for the three forms of plant food supplied were estimated as being \$4.79 a unit for nitrogen, \$1.19 a unit for available phosphoric acid and \$2.11 a unit for water soluble potash. Compared with unit values estimated for 1927 inspection season those for nitrogen and phosphoric acid were higher and for potash slightly lower.

The Complete Fertilizers, supplying nitrogen, available phosphoric acid and water soluble potash, included approximately two-thirds of the total samples and brands examined, numbering 1,562 samples and 452 brands registered by 71 companies. They were all guaranteed to contain 14 per cent. or more total plant food, as is required by the law. Of this number 220, or 14.1 per cent. of the samples, failed to meet their guarantees in one or more forms of plant food. There were 51, or 3.3 per cent., deficient in nitrogen, 66, or 4.2 per cent., deficient in available phosphoric acid, and 123, or 7.9 per cent., deficient in water soluble potash. This class of materials averaged 2.10 per cent. nitrogen, 10.83 per cent. total phosphoric acid, 10.06 per cent. available phosphoric acid, .77 per cent. insoluble phosphoric acid and 5.71 per cent. potash. The average retail selling price was estimated as being \$34.08 a ton, compared with an average of \$31.94 estimated for 1927. Of the total number of samples 1,438 supplied potash in the muriate form, 21 as sulphate and 103 as both muriate and sulphate of potash. There were only 3 samples having the word "tobacco" as a part of the brand name, all of which supplied potash in the sulphate form. The 452 brands of Complete Fertilizers included 86 different formula grades, which were guaranteed to contain from 1 to 18.25 per cent. of nitrogen, from 4 to 30 per cent. of available phosphoric acid and from 1 to 15 per cent. of water soluble potash. The formula grades ranged from 1-8-5 to 18 $\frac{1}{4}$ -30-15. Those grades of which the larger number of brands and samples were represented, together with the average selling price per ton, were as follows: 217 samples 1-9-4, \$27.64 a ton; 275 of 2-8-5, averaging \$30.04; 205 of 2-8-10, averaging \$34.34; 118 of 2-12-4, averaging \$31.51; 89 of 2-9-3, averaging \$30.30; 78 of 2-12-2, averaging \$30.24; 118 of 2-12-4, averaging \$31.51; 32 of 2-16-8, averaging \$40.65; 46 of 3-10-6, averaging \$35.85; 14 of 3-12-5, averaging \$33.99; 15 of 4-8-4, averaging \$41.70; 31 of 4-8-6, averaging \$37.71; 97 of 4-8-7, averaging \$38.28; 30 of 4-12-4, averaging \$55.24; 42 of 4-16-4, averaging \$43.96; 16 of 4-16-10, averaging \$50.01; 21 of 5-8-5, averaging \$45.91, and 13 of 5-8-7, averaging \$46.08. The highest values were represented by one brand of 8-7-6, retailing at \$100 and one of 18 $\frac{1}{4}$ -30-15, selling at \$110 a ton.

The Ground Bone Fertilizers, supplying nitrogen and total phosphoric acid, included 60 official samples and 26 brands, registered by 20 companies, and were found upon analysis to average 3.44 per cent. nitrogen and 24.02 per cent. total phosphoric acid, selling at an average of \$55.49 a ton, compared with \$50.09 a ton, the average estimated for 1927. Eight, or 13.3 per cent., of the samples failed to meet their guarantees, 2, or 3.3 per cent., being deficient in nitrogen and 6, or 10.0 per cent., deficient in total phosphoric acid.

The Superphosphate Fertilizers, supplying phosphoric acid in an available form, were represented by 360 samples and 83 brands, registered by 54 companies. This class of Fertilizers for many years has been classified as Acidulated Phosphate Fertilizers or as Acid Phosphates, the product resulting from treating pulverized phosphate rock with sulphuric acid, which renders available the phosphoric acid combined with calcium in the product before

processing. Fertilizer Manufacturers and State Officials in conference to adopt more uniform names and definitions for the various types of fertilizer materials have recently agreed to designate Acidulated Phosphates or Acid Phosphate Fertilizers as Superphosphate Fertilizers. Therefore in this and in future reports this class of materials will be designated as Superphosphate Fertilizers. Of this class 34 samples, including 13 brands, were classified as Lime Phosphate Fertilizers so named because they are Superphosphate Fertilizers prepared for special purposes by the addition of lime products, which slightly reduce the content of phosphoric acid. The Superphosphate Fertilizers averaged 18.79 per cent. total phosphoric acid, 18.06 per cent. available phosphoric acid and .73 per cent. insoluble phosphoric acid, retailing at an average of \$21.51 a ton or at the rate of \$1.19 a unit for available phosphoric acid, compared with \$19.05 a ton and \$1.06 a unit, as estimated for the brands examined during the 1927 inspection. Four, or 1.2 per cent., of the samples of this class were deficient in available phosphoric acid. There were 16 brands guaranteed to contain 20 per cent. available phosphoric acid.

The Lime Phosphate Fertilizers had an average analysis of 15.39 per cent. total phosphoric acid, 13.80 per cent. available phosphoric acid, 1.59 per cent. insoluble phosphoric acid and retailed at an average of \$21.88 a ton, or at the rate of \$1.59 a unit for available phosphoric acid, as supplied by this class of materials. There were 3, or 8.8 per cent., of the samples which were deficient.

The class of Rock and Potash Fertilizers, supplying available phosphoric acid and water soluble potash, was represented by 174 samples and 57 brands, registered by 39 companies, and averaged in composition 12.02 per cent. available phosphoric acid and 5.77 per cent. potash. The retail selling values averaged \$26.46 a ton, compared with \$24.92 a ton, as estimated for the preceding season's brands. They were all guaranteed to contain 14 or more per cent. total units and 19, or 10.9 per cent., of the samples were found to be deficient, there being 6, or 3.5 per cent., deficient in available phosphoric acid and 14, or 8.1 per cent., deficient in potash. In 166 of the samples the potash was supplied in the muriate form and 8 samples contained potash in both muriate and sulphate forms.

The Miscellaneous Fertilizers included 135 official samples and 70 different brands, registered by 30 companies. Ten, or 7.4 per cent., of the samples failed to meet their guarantees in one or more forms of plant food which they were advertised to contain. There were 2, or 1.5 per cent., of the samples low in nitrogen and in total phosphoric acid and 6, or 4.4 per cent., were deficient in potash. The following materials with their average compositions and retail selling prices included in this class were as follows: Nitrate of Soda, 51 samples, averaging 15.53 per cent. nitrogen and \$66.41 a ton; Sulphate of Ammonia, 23 samples, averaging 20.90 per cent. nitrogen and \$73.02 a ton; Dried Fish, 1 sample containing 7.73 per cent. nitrogen; Tankage, 12 samples, averaging 6.57 per cent. nitrogen and \$54.68 a ton; Kainit, 4 samples, averaging 13.37 per cent. potash and \$19.67 a ton; Manure Salt, 1 sample containing 21.10 per cent. potash and reported as selling

at \$25.20 a ton; Muriate of Potash, 39 samples, averaging 50.68 per cent. potash and \$53.84 a ton; Sulphate of Potash, 1 sample, analyzing 48.48 per cent. potash and selling at \$60 a ton, and 3 unclassified miscellaneous materials, as will be noted in the table.

In the following pages will be found Acknowledgments; Table I, showing Number of Deficiencies in Each Class; Table II, Average Analyses and Retail Prices; Key to Tables, explaining the large tables which follow, showing results of chemical analyses in detail of each official sample received from the Agents, together with brand names and names of selling agents, guarantees for the several forms of plant food which they contained and retail selling prices; Table III, Complete Fertilizers; Table IV, Ground Bone Fertilizers; Table V, Superphosphate Fertilizers; Table VI, Rock and Potash Fertilizers, and Table VII, Miscellaneous Fertilizers.

ACKNOWLEDGMENTS

Mr. V. B. Hausknecht, First Assistant Chemist, in charge of the Chemical Laboratory, had immediate supervision of the reception and analyses of the official samples, the approval of applications for registration and the issuing of licenses and the preparation of the Tables included in this Report. The microscopical examinations were made by H. E. Gensler, Assistant Chemist and Micro-Analyst, and the following Assistant Chemists performed the chemical analyses: G. J. Kuhlman, Jr., F. B. Williams, Claude R. Engle, Harold Y. Fisher, Joseph F. Bradley and Robert B. Kilborn. The samples were prepared for analysis by Myrle W. Copeland, Laboratory Assistant.

KEY TO TABLES

The following tables include the detailed results of chemical analyses of each sample. All samples were given a chemist's number as shown in the extreme left and right hand columns and are grouped in alphabetical order of manufacturers and brand names. Each class is shown in separate tables and the following information will serve as a key to these tables:

The asterisk (*) indicates the cases where total nitrogen, available phosphoric acid and total potash are deficient to the extent of .2 per cent. or more below their respective guarantees. In cases where the guarantees are .5 per cent. or less the deficiencies noted are where the amount is .1 per cent. or more below the guarantees.

Order of results of analysis: Total Nitrogen found and Guaranteed, Total Phosphoric Acid found and guaranteed: Available Phosphoric Acid found and guaranteed; Insoluble Phosphoric Acid found and guaranteed; Total Potash found and guaranteed and Potash as Muriate and as Sulphate.

To determine the formula of any brand, as guaranteed, multiply Total Nitrogen guaranteed by 1.2158 to obtain Ammonia and then use this figure and the guarantees for Available Phosphoric Acid and Total Potash. For example, Nitrogen guarantee equals .82% (.82 x 1.2158 = 1%). Ammonia equals 1%; Available Phosphoric Acid, 8%, Potash, 1%. Formula therefore is 1-8-1.
